Getting Started

1. In the filtering panel, select your target flood frequency and watershed type.

Figure 1: 0.2% Flood Frequency and NHD Catchments selected

2. (Optional) Upload a **zipped** shapefile of your area of interest.

Figure 2: Uploaded, zipped shapefile added to the map

3. Select which filters to apply along with adjusting the corresponding minimum and maximum values.

Figure 3: Applied water quality filters

4. Turn on any helpful supporting layers and adjust transparency.

Figure 4: Added the National Wetlands Inventory and the EWG Ecological Significance supporting layers with more transparency

5. Click a watershed on the map to display the results panel.

Figure 5: NHD Catchment selected with results displayed

6. Click “Save Map” to download a PDF containing a screenshot of your current map, a list of the applied filters, and the selection results.
